Success Metrics 4
Step 5 **5**
Pitfalls & Mitigations 5

Step 1

Brainstorm solutions

Problem focus: Helping Amazon customers make confident purchase decisions by improving product comparison, review trust, delivery transparency, and recommendation relevance.

Solution	Short Description	Key Assumption	Category
Customer Similarity Reviews	Prioritizes reviews from customers with recent and similar purchase history making feedback more relevant and trustworthy.	Users trust experiences from customers similar to themselves more than generic reviews.	High Confidence
Product Comparison	Automatically generates a concise comparison of selected products highlighting the most meaningful differences.	Users are overwhelmed by specifications and want help identifying key differentiators.	High Confidence
Delivery Reliability Score	Displays a delivery confidence score based on seller performance, location, logistics history, and delay patterns to set realistic expectations.	Users care about delivery reliability as much as promised delivery dates.	Medium Confidence
User Intent Selection	Allows users to specify their current shopping objective (Lowest Price, Best Quality, Fastest Delivery, Premium Brand, etc.), enabling more accurate recommendations.	User intent changes between shopping sessions and cannot always be inferred from historical behavior.	Medium Confidence
Smart Buying Assistant	AI synthesizes price, reviews, delivery reliability, alternatives, and user preferences to recommend the best product with clear reasoning.	Users want confident purchase decisions rather than spending time evaluating multiple products manually.	Moonshot

Step 2

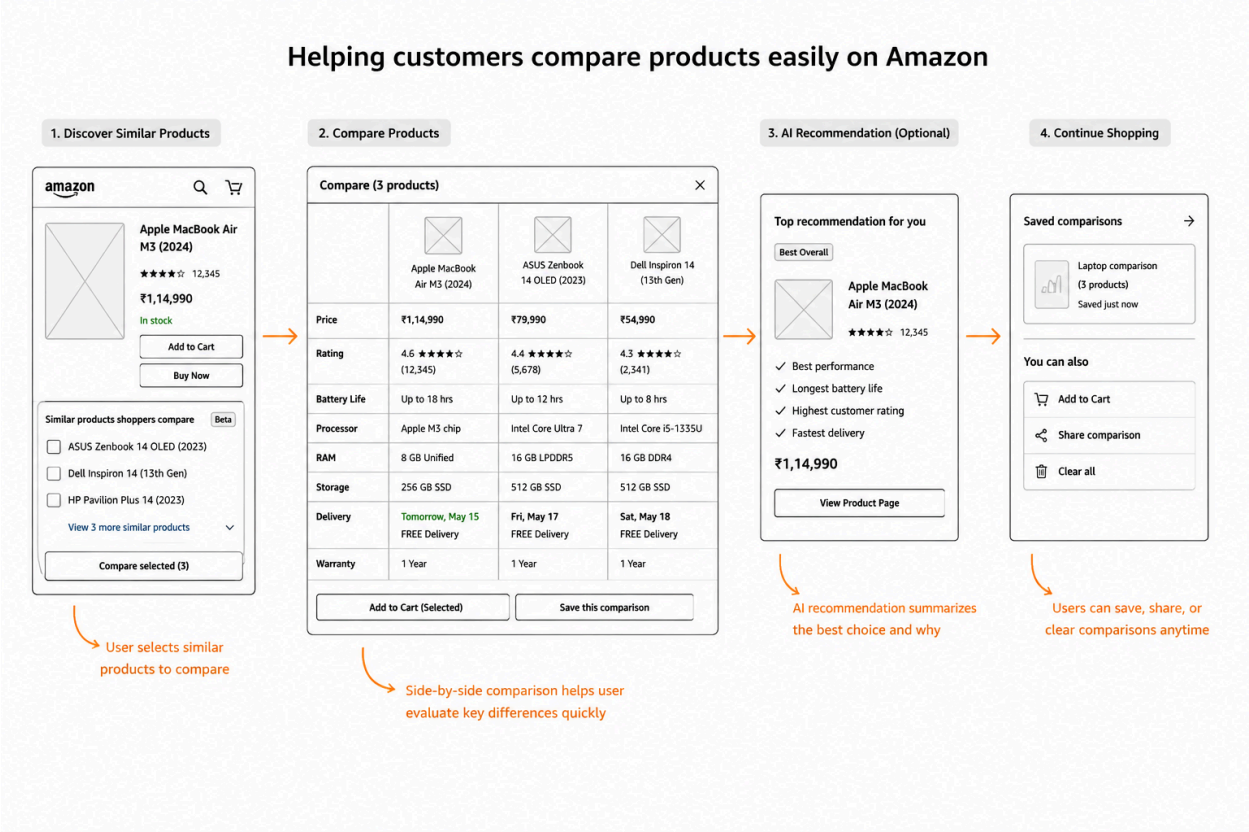

Prioritization

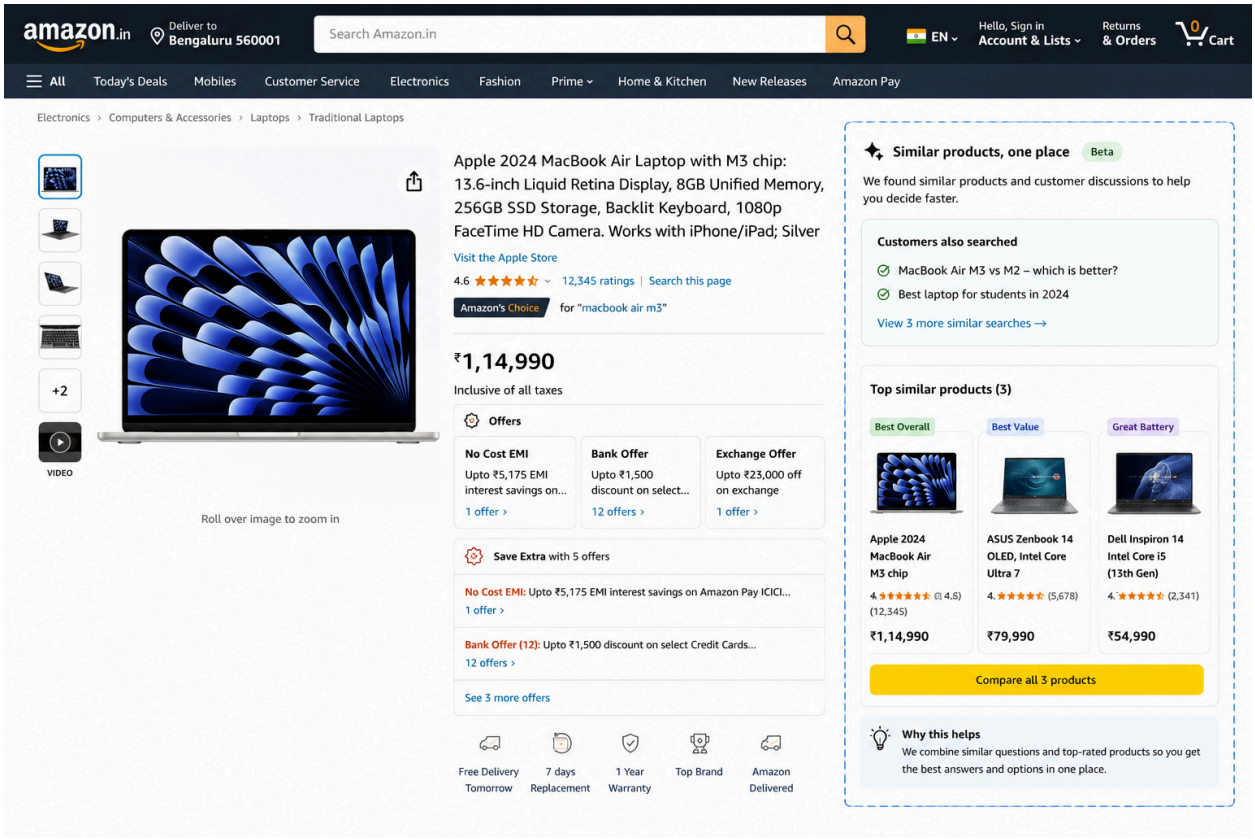

Solution	Reach (1-3)	Impact (1-3)	Confidence (1-3)	Effort (1-3)	RICE score	Rationale
Product Comparison	3	3	3	1	27	Most shoppers compare multiple products before buying. Making comparisons easier can reduce decision time and help customers purchase with greater confidence.
Customer Similarity Reviews	3	3	2	2	9	Customers often struggle to know which reviews to trust. Seeing reviews from people with similar purchase behavior can make feedback feel more relevant and credible.
User Intent Selection	3	2	3	2	9	Customer priorities change from one shopping session to another. Explicitly capturing intent helps Amazon provide recommendations that better match what the customer wants right now.
Delivery Reliability Score	2	3	2	2	6	Delivery delays can create frustration and reduce trust. Providing a realistic delivery confidence score helps customers set expectations before placing an order.
Smart Buying Assistant	3	3	1	3	3	This could significantly simplify shopping by bringing together reviews, pricing, delivery, and recommendations in one place. Need significant AI complexity.

(Reach × Impact × Confidence) ÷ Effort = RICE

Step 3

Step 4

Success Metrics

Metric Type	Metric Name	Definition	Why it matters
Key Metric	Purchase Conversion Rate	% of users who complete a purchase after viewing a product detail page.	Directly measures whether customers can make purchase decisions more confidently and efficiently.
Secondary Metric	Product Comparison Usage Rate	% of shoppers who use the Product Comparison feature before purchasing.	Measures adoption of the primary solution and whether customers find comparison assistance valuable.

Secondary Metric	Trusted Review Engagement Rate	% of users who interact with Customer Similarity Reviews before purchasing.	Measures whether users find personalized reviews useful when making decisions.
Secondary Metric	Delivery Confidence Utilization Rate	% of users who view Delivery Reliability information before purchasing.	Measures adoption of delivery transparency features.
Guardrail Metric	Product Return Rate	% of purchased products returned within the return window	Ensures increased conversion is driven by better purchase decisions rather than poor product choices

Goal: Increase purchase conversion rate by 5–8% within 6 months by helping customers compare products more effectively, trust reviews, understand delivery reliability, and receive more relevant recommendations.

Step 5

Pitfalls & Mitigations

Assumption at Risk	Failure Mode	Impact	Likelihood	Mitigation	Detection Signal	Containment / Rollback
Customers use Product Comparison	Users ignore comparison tool	High	Medium	Highlight comparison CTA on product pages	Low Product Comparison Usage Rate; low CTR on "Compare Products" button	Reposition comparison feature higher on PDP; simplify comparison flow; revert to basic comparison table
Similarity Reviews improve trust	Users find review matching inaccurate	Medium	Medium	Show why a reviewer is considered similar	Low engagement with Similarity Reviews; increase in	Reduce weighting of similarity matching; revert to standard review ranking

					"Not Relevant" feedback	
Delivery Reliability Score is trusted	Predictions are inaccurate	High	Low	Start with conservative confidence estimates	Increase in delivery-related complaints; gap between predicted and actual delivery performance	Disable reliability score temporarily; show standard delivery estimates only
Intent Selection improves recommendations	Users don't want additional input steps	Medium	Medium	Make selection optional and easy to skip	Low intent-selection completion rate; increased drop-off during browsing	Remove mandatory prompts; use inferred intent from browsing behavior
Smart Buying Assistant recommendations are trusted	Users prefer manual research	Medium	Medium	Provide clear reasoning and alternative options	Low assistant usage rate; low recommendation acceptance rate	Roll back to recommendation-only mode; keep assistant as optional feature
