Problem Hypothesis 7

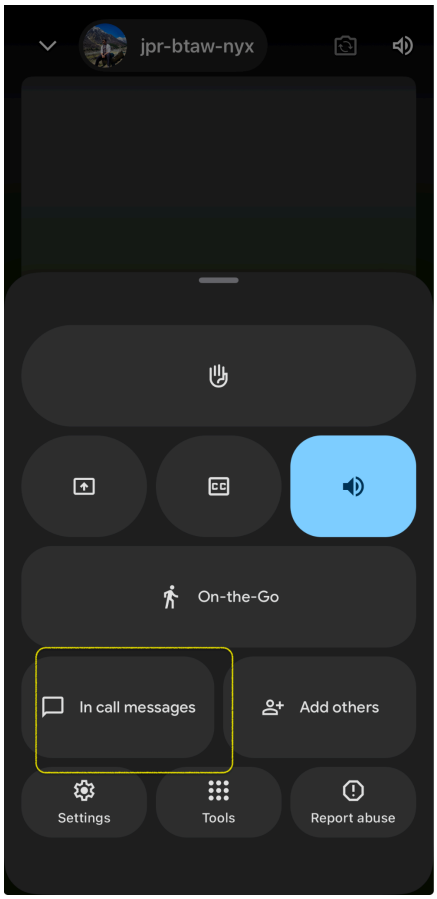

Step 1

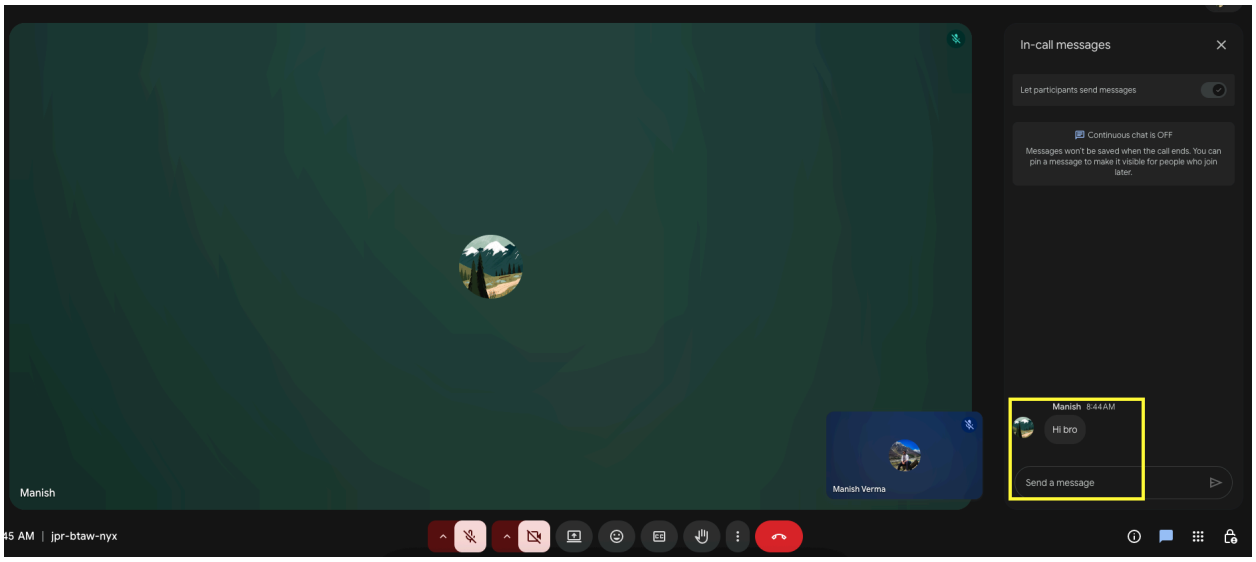

Getting started with the Product Analysis - Flows & Frictions

S. No	Flows / Touchpoints	What works well	Confusion / Friction
1	Signup → login	Social login → Fast entry	• Too many permission prompts upfront • Confusing mic / camera permission errors
2	In meeting → Experience of Users	Stable audio over video priority	Too many controls on screen & hard to find basic actions
3	Chat → Interaction with participants	Persistent chat visibility via sound ping	• Chats getting buried after meeting. • Messages missed during presentation. • No clear distinction between private & group chat.
4	Exit → Post meeting	Immediate meeting end	• Accidental leave. • No quick summary of the meeting available like the duration or restoration of chats.

Below are the few images for the respective workflow.

Step 2

Company context (Mission, Revenue & Differentiators)

S. No	Field	Context
1	Mission	Secure, easy to use & reliable video conferencing service that helps people stay connected & collaborate from anywhere, on any device.
2	Revenue streams	1. Google workspace subscription 2. Tiered plans for businesses
3	User value	• Browser based • No install accessibility • Deep integration with Google workspace • Simpler & user-friendly interface • Quick & suitable in low bandwidth frictionless meetings
4	Business value	• It grows the business by registering conversion of the guest into a platform user. • Sync in with calendar, email and workflow integrations leading to conversion into subscription plans for maximum efficiency & top-end features. • Additionally, Google has its own brand trust &

		reliability among its millions of customers.
5	Key Differentiators	1. Microsoft teams: *Corporate interface.* Google meet offers an easy & quick setup without heavy resource usage & org-level surveillance fears. 2. Zoom: *For power users needing breakout rooms, webinars & loads of control.* Google meet works effortlessly in a low-bandwidth network area without tuning it to the latest update manually & has a simpler UI to distinguish actions. 3. Discord: *Hub for streamers & gamers.* Google meet is a focused tool due to which it has less notification overload & no reaction-heavy interfaces.

Step 3

Feature Reverse-Engineering

S. No	Feature	Problem it solves	How it works	Why it works
1	No installation required & Quick access	*"I don't want to waste time downloading, installing & updating software."*	Operates directly within a web browser on desktop & via app on mobile.	• For Users: No app download → Universal access across shared devices. • For Business: Higher join success rate → More completed meetings → More guest users → Higher future conversion opportunities.
2	Better quality communication & collaboration	*"I find it difficult to follow low quality meetings or*	Provides stability on weaker connections & resource-efficient by providing	• For Users: Conversations remain stable → Meeting doesn't completely fail → Audio status

		understanding participants.”	AI-generated captions in real time.	when video drops. • For Business: Reliability build trust → Reduces infrastructure cost → Viable in global market.
3	Flexible user experience	*“I may need to be in the meet on a small screen or while moving.”*	“On-the-Go” mode provides a mobile interface for users joining while travelling, making it safer to participate.	• For Users: Supports partial presence → Fits real chaos • For Business: Increased likelihood of workspace adoption → More often it gets used.

Step 4

User segmentation

S. No	Primary segment	Sub-segments	Key needs / Use cases	User Problems
1	Professional users	Individual contributors	Join quickly, clear audio, minimal friction	
		Managers / Hosts	Run structured meetings, maintain order	• Host overload • Limited participant control. • No post-meeting continuity.
		External guests	Fast guest access	• Unclear permissions. • Uncertainty during a live meeting.
2	Education users	Teachers / Instructors	• Control • Low-bandwidth	• One size fits all UI.

			reliability	• Inability to manage nuisance. • Chat loss after class.
		Students	Low data usage	• Poor recovery from drops. • Chat loss after the meeting ends.

Step 5

Problem Hypothesis

Priority	Problem Hypothesis	Why I picked it	Gut confidence
1	**Chat is lost after meeting.** ➔ Users rely on live chat to capture important meeting content but when it ends, it leads to poor post-meeting continuity & manual work.	• Affect every meeting type. • Breaks post-meeting experience.	HIGH
2	**Captions are not available in meeting recordings.** ➔ Users who depend on captions during live meetings cannot access the same captions in recording thus reducing accessibility & usefulness of recordings.	Creates inconsistency between live & post-meeting experience.	MEDIUM
