Phase 3: Features, Prioritization + PRD

Step 1 1
Brainstorm solutions 1
Step 2 **2**
Prioritization 2
Step 3 **3**
Wireframe 3
Step 4 **4**
Success Metrics 4
Step 5 **5**
Pitfalls & Mitigations 5

Step 1

Brainstorm solutions

Problem focus: Post-meeting chat continuity for working professionals.

Solution	Short Description	Key Assumption	Category
Credibility Labeling (Fact / Opinion / Experience)	AI automatically tags answers as "Evidence-backed," "Personal experience," or "Opinion-based," visible at the top of each answer.	Users want quick credibility signals before reading long answers.	High Confidence
AI-Generated Answer Summary	Generate a structured 3–5 line summary at the top of long threads highlighting key insights and disagreements.	Users prefer condensed clarity before committing time to full threads.	High Confidence
Canonical "Best Structured Answer"	AI synthesizes multiple high-quality responses into one structured canonical answer displayed at the top.	Users prefer one clear, structured answer over scattered opinions.	Medium Confidence
Expert Verification Badge	Identify domain experts based on history, credentials, and engagement quality; show verified badge next to answers.	Visible expertise increases perceived trust and retention.	Medium Confidence
AI Duplicate Question Merge	Detects and merge similar questions into one canonical thread automatically.	Reducing duplication improves clarity and signal-to-noise ratio.	High Confidence
Moderation	When content is	Transparency	Medium Confidence

Explanation Assistant	removed, AI explains the specific policy violation and suggests corrections.	reduces contributor churn and moderation frustration.	
Reputation-Based Ranking (Beyond Upvotes)	Use AI quality signals (depth, citations, historical accuracy) instead of just upvotes to rank answers.	Upvotes alone do not reflect answer quality accurately.	High Confidence
Personalized Trust Mode	Users can toggle “High Credibility Mode” to see evidence-backed answers ranked first.	Some users prioritize accuracy over diversity of opinion.	Moonshot

Step 2

Prioritization

Solution	Reach (1-3)	Impact (1-3)	Confidence (1-3)	Effort (1-3)	RICE score	Rationale
Credibility Labeling (Fact / Opinion / Experience)	3	3	3	2	13.5	Affects the majority of search-driven users. Directly addresses the trust gap. Strong survey & review backing. Moderate AI + UX effort.
AI Duplicate Question Merge	3	2	3	1	18	High reach across all categories. Reduces noise immediately. Lower engineering effort via NLP clustering. Strong structural improvement.
AI-Generated Thread Summary	3	3	2	3	6	High impact for long threads but AI-dependent and higher compute effort. Needs careful rollout.
Reputation-Based	2	3	2	3	4	Valuable for quality improvement but algorithm

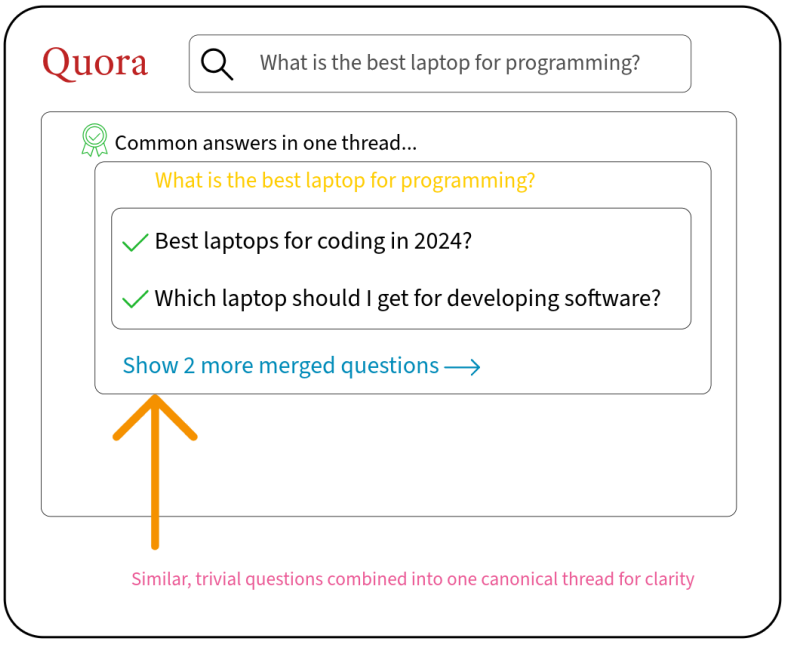

Ranking (Beyond Upvotes)						redesign is complex and politically sensitive.
Moderation Explanation Assistant	2	2	2	2	4	Improves contributor trust but affects a smaller segment compared to seekers. Moderate build effort.
Canonical Structured Answer (AI Synthesized)	2	3	1	3	1.33	Potentially transformative but assumption-heavy, AI-risk prone, and high engineering effort.

(Reach × Impact × Confidence) ÷ Effort = RICE

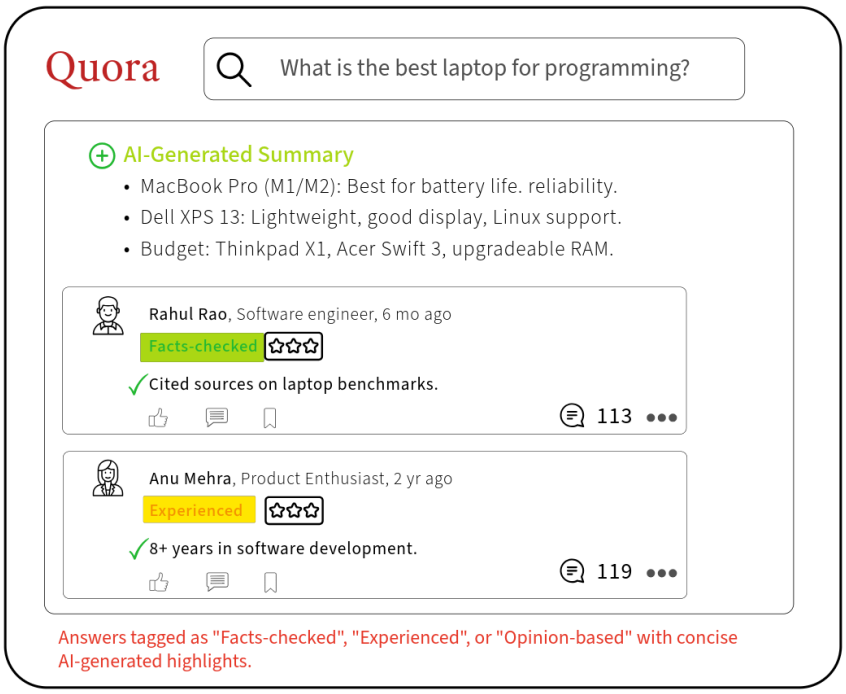

Step 3

AI duplicate question merge

Credibility Labeling & Summary

Step 4

Success Metrics

Metric Type	Metric Name	Definition	Why it matters
Key Metric	30-Day Meeting Retention Rate (High-Intent Search Users)	% of search-driven users in top 5 categories who return and view at least one additional answer within 30 days	Directly measures whether improved credibility and clarity increase repeat usage and trust.
Secondary Metric	Credibility-Labeled Answer CTR	% of users who click on answers marked with credibility labels (Fact-Checked, Experienced, etc.)	Indicates whether trust signals influence user behavior
Secondary Metric	AI Summary	% of sessions where	Measures perceived

	Engagement Rate	users expand or interact with AI-generated summary	usefulness of structured summaries
Secondary Metric	Duplicate Thread Reduction Rate	% reduction in similar questions within selected categories after AI merge rollout	Indicates improvement in signal-to-noise ratio
Guardrail Metric	Answer Creation Rate	% change in number of new answers posted per day	Ensures ranking/AI changes do not discourage contributors
Guardrail Metric	Contributor Retention (30-Day)	% of active answer writers who continue posting after 30 days	Protects supply-side health of ecosystem
Guardrail Metric	Moderation Appeal Rate	% increase in moderation appeals after AI rollout	Detects unintended bias or AI misclassification issues

Goal: Increase 30-day retention of high-intent search users by 5–10% within 6 months by improving answer credibility visibility and reducing low-signal content exposure on Quora.

Step 5

Pitfalls & Mitigations

Assumption at Risk	Failure Mode	Impact	Likelihood	Mitigation	Detection Signal	Containment / Rollback
Users want credibility labels to guide decisions	Users ignore or distrust AI labels	High	Medium	Start with soft-labeling (e.g., "AI-assisted insight"), show source links, avoid overclaiming "verified"	Low CTR on labeled answers; negative feedback on trust surveys	Reduce prominence of labels; revert to optional toggle mode
AI summaries	Summaries oversimplify	High	Medium	Limit to top 3 ranked	Increase in answer	Disable summaries in

improve clarity	or misrepresent nuanced discussions			answers; add “View full context” button; continuous quality evaluation	reports; drop in session depth	affected categories; fallback to manual highlights
Duplicate question merge improves clarity	Users feel their question is suppressed or merged incorrectly	Medium	Medium	Show clear “Merged with similar question” message; allow manual override	Spike in duplicate repost attempts; support complaints	Temporarily disable auto-merge; switch to suggestion-based merge
Credibility ranking increases trust	Contributors feel demoted or unfairly ranked	High	Medium	Transparent ranking signals; gradual rollout; contributor education	Drop in answer creation rate; increase in moderation appeals	Rollback ranking weight; revert to previous ordering
AI system reduces low-signal content	AI misclassifies legitimate content as low-quality	High	Low–Medium	Human review for high-impact categories; conservative thresholds initially	Sudden spike in content removal appeals	Reduce AI threshold; restore removed answers quickly
Improved trust increases retention	Behavior does not change despite new features	Medium	Medium	Run controlled A/B tests in top 3 categories; validate leading indicators before full rollout	No lift in 30-day retention; flat session depth	Stop rollout expansion; refine feature based on experiment learnings
